# Triangle Questions for SSC Exams (CGL Tier 1, CGL Tier 2 & SSC 10+2)

## Triangle Quiz 2

Directions: Study the following questions carefully and choose the right answer:

1. The in-radius of an equilateral triangle is of length 3 cm. Then the length of each of its medians is

- A. 12 cm      B.  $\frac{9}{2}$  cm      C. 4 cm      D. 9 cm

2. If the orthocentre and the centroid of a triangle are the same, then the triangle is :

- A. Scalene      B. Right angled      C. Equilateral      D. Obtuse angled

3. If in a triangle, the circumcentre, incentre, centroid and orthocentre coincide, then the triangle is

- A. Acute angled      B. Isosceles      C. Right angled      D. Equilateral

4. In a triangle, if three altitudes are equal, then the triangle is

- A. Obtuse      B. Equilateral      C. Right      D. Isosceles

5. If ABC is an equilateral triangle and D is a point on BC such that  $AD \perp BC$ , then

- A.  $AB : BD = 1 : 1$       B.  $AB : BD = 1 : 2$       C.  $AB : BD = 2 : 1$       D.  $AB : BD = 3 : 2$

6. The side QR of an equilateral triangle PQR is produced to the point S in such a way that QR = RS and P is joined to S. Then the measure of  $\angle PSR$  is

- A.  $30^\circ$                       B.  $115^\circ$                       C.  $60^\circ$                       D.  $45^\circ$

7. If the circumradius of an equilateral triangle be 10 cm, then the measure of its in-radius is

- A. 5 cm                      B. 10 cm                      C. 20 cm                      D. 15 cm

8. If the incentre of an equilateral triangle lies inside the triangle and its radius is 3 cm, then the side of the equilateral triangle is

- A.  $9\sqrt{3}$  cm                      B.  $6\sqrt{3}$  cm                      C.  $3\sqrt{3}$  cm                      D. 6 cm

9. In a triangle, if orthocentre, circumcentre, incentre and centroid coincide, then the triangle must be

- A. obtuse angled                      B. isosceles                      C. equilateral                      D. right-angled

10. If ABC is an equilateral triangle and P, Q, R respectively denote the middle points of AB, BC, CA then.

- A. PQR must be an equilateral triangle  
B.  $PQ + QR + PR = AB$   
C.  $PQ + QR + PR = 2AB$   
D. PQR must be a right angled triangle

**Correct Answers:**

<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>	<b>8</b>	<b>9</b>	<b>10</b>
D	C	D	B	C	A	A	B	C	A

**Explanations:**

**1.**

In equilateral triangle centroid, incentre, orthocentre coincide at the same point.

$$\therefore \frac{\text{Height}}{3} = \text{in-radius}$$

$$\therefore \text{Height} = 3 \times \text{in-radius} = 3 \times 3 = 9 \text{ cm.}$$

Hence, option D is correct.

**2.**

In equilateral triangle orthocentre and centroid lie at the same point.

Hence, option C is correct.

**3.**

In an equilateral triangle, centroid, incentre etc lie at the same point.

Hence, option D is correct.

**4.**

Triangle will be equilateral.

Hence, option B is correct.

**5.**

Let  $AB = BC = CA = 2x$  units

We know that a perpendicular from any vertex of an equilateral triangle bisects the opposite side.

$$\therefore BD = CD = x \text{ units}$$

$$\therefore AB : BD = 2x : x = 2 : 1.$$

Hence, option C is correct.

**6.**

$$\angle PRQ = 60^\circ \quad [\because \Delta PQR \text{ is an equilateral}]$$

$$\angle PRS = 180^\circ - 60^\circ = 120^\circ$$

$$\angle PSR + \angle RPS = 180^\circ - 120^\circ = 60^\circ \quad \dots(i)$$

$$\text{As } QR = RS$$

$$\therefore PR = RS \quad [\because \Delta PQR \text{ is an equilateral}]$$

$$\therefore \angle PSR = \angle RPS$$

From Eq (i),

$$2\angle PSR = 60^\circ$$

$$\therefore \angle PSR = 30^\circ$$

Hence, option A is correct.

**7.**

$$\text{Let } AB = x \text{ cm}$$

$$\therefore BD = \frac{x}{2} \text{ cm}$$

By pythagoras theorem in  $\Delta ABD$ ,

$$\begin{aligned} AD &= \sqrt{AB^2 - BD^2} \\ &= x^2 - \frac{x^2}{4} = \frac{\sqrt{3}}{2} x \text{ cm} \end{aligned}$$

We know that,

$$\text{In-radius} = \frac{1}{3} \times \text{height}$$

$$\therefore OD = \frac{1}{3} \times \frac{3}{2} x = \frac{x}{2\sqrt{3}} \text{ cm}$$

By pythagoras theorem in  $\Delta BOD$ ,

$$\begin{aligned} OB &= \sqrt{BD^2 + OD^2} \\ &= \sqrt{\frac{x^2}{4} + \frac{x^2}{12}} = \sqrt{\frac{4x^2}{12}} = \frac{x}{\sqrt{3}} \end{aligned}$$

Given,

Circumradius,  $OB = 10 \text{ cm}$

$$\therefore \frac{x}{\sqrt{3}} = 10 \Rightarrow x = 10\sqrt{3} \text{ cm}$$

Hence,

$$\text{In-radius, } OD = \frac{x}{2\sqrt{3}} = \frac{10\sqrt{3}}{2\sqrt{3}} = 5 \text{ cm}$$

Hence, option A is correct.

**8.**

$$\text{In-radius} = \frac{\text{Side}}{2\sqrt{3}}$$

$$\Rightarrow 3 = \frac{\text{Side}}{2\sqrt{3}}$$

$$\Rightarrow \text{Side} = 3 \times 2\sqrt{3} = 6\sqrt{3} \text{ cm}$$

Hence, option B is correct.

**9.**

In an equilateral triangle, orthocentre, circum-centre, incentre and centroid coincide.

Hence, option C is correct.

**10.**

The line segments joining the mid points of the sides of a triangle form four triangles, each of which is similar to the original triangle.

Hence, option A is correct.
