DI Mixed Chart Quiz 59

Directions : Study the following line and bar chart carefully and answer the questions given beside.

The charts given below give the statics of four different players. The line graph given below gives the information about the average number of runs per match scored by the players. The bar graph given below gives the information about the number of matches played by the players.

1. What is the difference between the number of runs scored by the player 1 in Oeday match and the total number of runs scored by the player 3 in test match?

- A. 3860 B. 4830 C. 4220 D. 4430 E. None of these

2. If the player 4 had scored, 20% of total test scored by boundaries, 60% of the remaining by double, and the remaining runs by single then how many runs did he score by single?

- A. 4042 B. 4062 C. 4032 D. 4140 E. None of these

3. What is the ratio of total number of runs scored by player 4 in test match to the total number of runs scored by player 2 in one day match?

- A. 180 : 31 B. 90 : 17 C. 5 : 1 D. 233 : 34 E. None of these

4. If the player 3 had scored 20% of the total oneday scores by boundaries then what can be the maximum number of sixers he could have hit in the total oneday matches?

- A. 256 B. 262 C. 259 D. 258 E. 260

5. The total number of runs scored by the player 4 in all the match (test and oneday together) is how much more than that by player 2?

- A. 10560 B. 10580 C. 10440 D. 11320 E. None of these

Correct Answers:

1	2	3	4	5
B	C	B	E	A

Explanations:

1. The number of runs scored by the player 1 in Oneyday match = $40 \times 45 = 1800$ runs

The total number of runs scored by the player 3 in test match = $85 \times 78 = 6630$

The required difference = $6630 - 1800 = 4830$

Hence, option B is correct.

2. The total test score of player 4 = $90 \times 140 = 12600$

By boundaries = 20% of 12600 = 2520

By double, 60% of $(12600 - 2520) = 60\%$ of 10080 = 6048

By single, = $10080 - 6048 = 4032$

Hence, option C is correct.

3. Total number of runs scored by player 4 in test match = 90×140 runs

The total number of runs scored by player 2 in oneday match = 68×35

The required ratio = $12600 : 2380 = 90 : 17$

Hence, option B is correct.

4. The score of player 3 in oneday = $65 \times 120 = 7800$

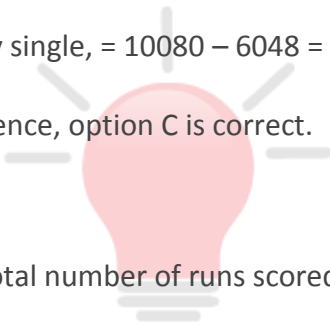

The total number of runs by boundaries = 20% of 7800 = 1560

Let the player 4 score x sixer and y four then

$$6x + 4y = 1560$$

It is possible that player 4 had scored 260 sixer and 0 four therefore the maximum number of sixer he had scored = 260

Hence, option E is correct.

The Question Bank

5. The total number of runs scored by the player 4 in all the match (test and oneday together) = $50 \times 32 + 90 \times 140 = 1600 + 12600 = 14200$

The total number of runs scored by the player 2 in all the match (test and oneday together) = $35 \times 68 + 30 \times 42 = 2380 + 1260 = 3640$

The required difference = $14200 - 3640 = 10560$

Hence, option A is correct.
