Simple Interest Questions for CDS, CLAT and SSC Exams.

Simple Interest Quiz 4

Directions: Kindly study the following Questions carefully and choose the right answer:

1. S.I for a sum of 1550 for 2 years rupees 20 more than the S.I for 1450 for the same duration. Find the rate of interest.

- A. 5% B. 10% C. 15% D. 24%

2. In a certain time, a sum becomes 3 times at the rate of 5% per annum. At what rate of interest the same sum becomes 6 times in same duration?

- A. 7% B. 9% C. 12.5% D. 17%

3. At what rate per cent per annum calculated in simple interest will a sum of money double in 10 year?

- A. 10% B. 12% C. 12.5% D. 13.5%

4. A sum of money lent on simple interest triples itself in 15 years and 6 months. In how many years will it be doubled?

- A. 6 yr 3 months B. 7 yr 9 months C. 8 yr 3 months D. 9 yr 6 months

5. A sum of money becomes 3 times in 5 year. In how many year will be the same sum become 6 times at the same rate of simple interest?

- A. 15 year B. 12.5 year C. 10 year D. 7.5 year

6. The principal on which a simple interest of Rs. 55 will be obtained after 9 months at the rate of $11\frac{1}{3}\%$ per annum is

- A. Rs. 1000 B. Rs. 1500 C. Rs. 2000 D. Rs. 2500

7. At what rate per cent per annum simple interest will a sum of money triple itself in 25 year?

- A. 8% B. 9% C. 10% D. 12%

8. If x, y, z are three such sums of money that y is the simple interest on x and z is the simple interest on y for the same time and at the same rate of interest, then we have

A. $z^2 = xy$

B. $xyz = 1$

C. $x^2 = yz$

D. $y^2 = zx$

9. The difference between simple interest and the true discount on Rs. 2400 due 4 years hence at 5% per annum simple interest is

A. Rs. 30

B. Rs. 80

C. Rs. 50

D. Rs. 70

10. A man buys a TV priced at Rs. 16000. He pays Rs. 4000 at once and the rest after 15 months on which he is charged a simple interest at the rate of 12% per year. The total amount he pays for the TV is

A. Rs. 18,200

B. Rs. 17,800

C. Rs. 17,200

D. Rs. 16,800

SmartKeeda
The Question Bank

Correct Answers:

1	2	3	4	5	6	7	8	9	10
B	C	A	B	B	C	A	D	B	B

Explanations:

1. According to question, we get
S.I. on 1550 – S.I. on 1450 = 20

$$\frac{1550 \times R \times 2}{100} - \frac{1450 \times R \times 2}{100} = 20$$

$$\frac{100 \times R \times 2}{100} = 20$$

R = 10%.

Hence, option B is correct.

2. To solve this question we can apply a short trick approach,

$$\text{Net percent rate } (r_2) = \left(\frac{y-1}{x-1} \right) \times r_1$$

Where:

x is the no. of times the sum becomes of itself in the 1st scenario = 3

y is the no. of times the sum becomes of itself in the 2nd scenario = 6

r₁ is the rate of interest in the 1st scenario = 5%

r₂ is the rate of interest in the 2nd scenario = ?

By the short trick approach, we get

$$\text{Required rate percent } (r_2) = \left(\frac{6-1}{3-1} \right) \times 5 = \frac{25}{2} = 12.5\%$$

Detailed Method:

Amount = P + S.I.

3P = P + S.I.; S.I = 2P

i.e. if Amount = 6P then S.I = 5P

$$S.I = \frac{P \times R \times T}{100}$$

$$2P = \frac{P \times R \times T}{100}$$

$$T = \frac{200}{R}$$

$$5P = \frac{P \times R \times 200}{100 \times 5}$$

$$R = \frac{25}{2}\% = 12.5\%$$

Hence, option C is correct.

3. Let principal = x, then amount = 2x

$$\therefore SI = A - P = 2x - x = x$$

$$\therefore SI = \frac{P \times R \times T}{100} \Rightarrow x = \frac{x \times r \times 10}{100} \Rightarrow \therefore r = 10\%.$$

Hence, option A is correct.

4. To solve this question we can apply a short trick approach,

$$\text{Required time } (t_2) = \left(\frac{x-1}{y-1}\right) \times t_1$$

Where **x** is the no. of times the sum becomes of itself in the 2nd scenario = 2

y is the no. of times the sum becomes of itself in the 1st scenario = 3

t is the time taken in the 1st scenario = 15 yr 6 months = $\frac{31}{2}$ yr

t₂ is the time taken in the 1st scenario = ?

By the short trick approach, we get

$$\text{Required time } (t_2) = \left(\frac{2-1}{3-1}\right) \times \frac{31}{2} = \frac{31}{4} = 7 \text{ yr 9 months.}$$

Detailed Method:

Let initial amount be Rs. P, then A = Rs. 3P and T = 15 yr and 6 months = $\frac{31}{2}$ yr

$$SI = A - P = \text{Rs. } 2P$$

$$\Rightarrow P \times \frac{31}{2} \times \frac{r}{100} = 2P \Rightarrow r = \frac{2 \times 2 \times 100}{31} = \frac{400}{31}$$

Let amount doubled in t_1 year.

$$\Rightarrow t_1 = \frac{SI \times 100}{P \times r} \Rightarrow t_1 = \frac{P \times 100 \times 31}{P \times 400} = \frac{31}{4} = 7 \text{ yr and 9 months.}$$

Hence, option B is correct.

5. To solve this question we can apply a short trick approach,

$$\text{Required time } (t_2) = \left[\left(\frac{y-1}{x-1} \right) \times t_1 \right] \text{ years.}$$

Where:

x is the no. of times the sum becomes of itself in the 1st scenario = **3**

y is the no. of times the sum becomes of itself in the 2nd scenario = **6**

t₁ is the time taken in the 1st scenario = **5 yr**

t₂ is the time taken in the 2nd scenario = **?**

By the short trick approach, we get

$$\text{Required time } (t_2) = \left[\left(\frac{6-1}{3-1} \right) \times 5 \right] = \frac{25}{2} = 12.5 \text{ yrs.}$$

Hence, option B is correct.

6. Let P be the principal.

Given that, SI = Rs. 55,

$$\text{time } (t) = 9 \text{ months} = \frac{9}{12} \text{ yr and rate } (r) = \frac{11}{3}\%$$

$$SI = \frac{P \times r \times t}{100}$$

$$\Rightarrow P = \frac{SI \times 100}{r \times t} = \frac{55 \times 100}{11 \times 9} \times 3 \times 12$$

$$= 5 \times 100 \times 4 = 2000$$

∴ Principal (P) = Rs. 2000.

Hence, option C is correct.

7. Let principal amount = P

As amount = 3P, t = 25 year

$$SI = 3P - P = 2P$$

$$\therefore \text{Rate} = \frac{100 \times SI}{P \times 25} = \frac{100 \times 2P}{P \times 25} = 8\%.$$

Hence, option A is correct.

8.

$$\text{S.I.} = \frac{P \times R \times T}{100}$$

$$\therefore y = \frac{x \times R \times T}{100} \quad \dots(\text{i})$$

$$\therefore z = \frac{y \times R \times T}{100} \quad \dots(\text{ii})$$

On dividing eqn. (i) by (ii) we get,

$$\therefore \frac{y}{z} = \frac{x}{y} \Rightarrow y^2 = zx.$$

Hence, option D is correct.

9. To solve this questions we can apply a short trick approach

Amount (A) = 2400/-, Rate of interest (R) = 5%, Time (T) = 4 yrs

$$\text{SI} - \text{TD} = \frac{A(R \times T)^2}{100(100 + R \times T)}$$

$$= \frac{2400 \times (5 \times 4)^2}{100(100 + 5 \times 4)}$$

$$= \frac{2400 \times 20 \times 20}{100 \times 120} = 80/-$$

Hence, option B is correct.

10. Given,

$$P = 16000 - 4000 = 12000, \quad r = 12\%$$

$$t = 15 \text{ months} = \frac{15}{12} \text{ yrs}$$

$$\text{SI} = \frac{12000 \times 12 \times (15/12)}{100} = \frac{12000 \times 12 \times 15}{100 \times 12} = 1800$$

$$\text{Total amount} = 16000 + 1800 = 17800/-$$

Hence, option B is correct.
